

PROJECT DOCUMENTATION: IKO KAZI

System Name: IKO KAZI (Localized Job Marketplace)

Target Platform: Web (Mobile-Responsive)

Development Stack: PHP, MySQL, HTML, CSS, JavaScript

1. Executive Summary

IKO KAZI is a digital solution designed to bridge the gap between local job seekers and employers. Unlike global platforms like LinkedIn, IKO KAZI focuses on the informal sector and small-to-medium enterprises (SMEs). The project's primary objective is to eliminate 'ghost jobs' by implementing a localized verification system, ensuring that job seekers find legitimate work within their immediate geographical vicinity.

2. Problem Statement

Trust Deficit: High prevalence of fraudulent job advertisements.

Accessibility Gap: Small businesses (kiosks, garages, local shops) lack a platform to find manual or skilled labor.

Digital Barrier: Traditional job boards are too complex and data-heavy for users with low-end smartphones.

3. System Requirements & Features

3.1 Functional Requirements (MVP)

- User Authentication: Secure registration and login using PHP sessions and password hashing (password_hash()).
- Profile Management: • Seekers: Upload CV (PDF) and list core skills. • Employers: Input company details and verification documents.
- Job Lifecycle: Employers can Create, Read, Update, and Delete (CRUD) job listings.
- Application Engine: A relational link between users and jobs, tracking status (Pending, Interviewing, Rejected).

3.2 Non-Functional Requirements

- Performance: Lightweight pages to ensure fast loading on 3G/4G connections.
- Security: Prevention of SQL Injection using PDO Prepared Statements.
- Usability: Mobile-first navigation for one-handed use.

4. Technical Design

4.1 Database Schema (ERD Logic)

Table: users
- user_id (INT, PK, AI)

- full_name (VARCHAR)
- email (VARCHAR, Unique)
- phone (VARCHAR)
- password (VARCHAR, Hashed)
- role (ENUM: 'seeker', 'employer', 'admin')

Table: jobs

- job_id (INT, PK, AI)
- employer_id (INT, FK -> users.user_id)
- title (VARCHAR)
- description (TEXT)
- location_tag (VARCHAR) - e.g., "Nairobi, Westlands"
- pay_type (ENUM: 'Daily', 'Weekly', 'Monthly')
- status (ENUM: 'Active', 'Closed')

Table: applications

- app_id (INT, PK, AI)
- job_id (INT, FK -> jobs.job_id)
- seeker_id (INT, FK -> users.user_id)
- cv_path (VARCHAR)
- status (VARCHAR, Default: 'Pending')

5. System Workflow (Logic Flow)

Onboarding: User selects a role. Employers must provide a phone number for verification.

Discovery: Job Seekers view a feed filtered by location_tag.

Application: Seeker clicks 'Apply.' System checks for CV in uploads directory and creates a record.

Review: Employer views applicants and updates status.

6. Implementation Plan (Milestones)

Phase	Task	Duration
Phase 1	Database Design & Environment Setup (XAMPP/LAMP)	Week 1
Phase 2	Backend Auth Logic (PHP/MySQL)	Week 2
Phase 3	Frontend UI Development (CSS/Bootstrap)	Week 3
Phase 4	File Upload System & Application Tracking	Week 4
Phase 5	Testing, Bug Fixing & Final Documentation	Week 5

7. Future Enhancements

- Geo-Location API: Automated 'Jobs Near Me' using browser GPS.
- SMS Integration: Sending interview invites via SMS.
- AI Matching: Suggest jobs based on skills.

8. Conclusion

IKO KAZI is more than a job board; it is a community trust tool. By focusing on PHP/MySQL, the system remains cost-effective to host and maintain, making it a sustainable project for local economic empowerment.
